LIMP BIZKIT.
EUROPE 2026.
V1 as of 07/01/2026.
Initial Lighting Notes.

The following notes are intended to support the attached lighting plots and kit lists.

These notes are being produced during the initial design and pre-production phase of the project. THINGS WILL CHANGE.

All notes and requests being made are subject to change, and are directed at the local suppliers for the forthcoming tour, both festival and Limp Bizkit's "own" gigs.

1/. Local lighting rig:

All lighting plots, unit types and patch sheets should be sent to Limp Bizkit's Lighting Designer (me, Martin Brennan) well in advance of the show, so that types and modes can be agreed. We do not require the huge DMX footprints that some bands demand. We use simple modes of all lights, especially LED wash, battens and strobe fixtures. We do not need to pixel map our rig. Cloning is hard enough with all of that stuff going on.

2/. Floor Plot:

There is no floor plot at the moment because the set design is still to be confirmed. At present, any floor package will be provided by Limp Bizkit's European lighting supplier. Any power and data requirements will be forwarded to all suppliers once the rig has been designed and agreed.

3/. Stage Set:

The above floor package will include the band's stage set, which will include some form of integral lighting within the set.

4/. Truss heights:

All truss heights indicated on the attached plots are merely advisory. Limp Bizkit's LD will confirm trim heights upon arrival at each venue. This is due to the fact that each festival will provide different size video screens, and we shall trim the trusses to suit the screens. The only proviso where possible, is that the bottom of the video screen will be 2 metres above stage floor level. Everything will be trimmed around that basic measurement.

5/. Pre-viz suite:

Where possible, a pre-visualisation suite should be provided for Limp Bizkit's LD to use on the day of the show, if there has not been an opportunity to pre-program on site the night before the show. An MVR file and a WYG file will be provided in advance of the tour.

6/. Haze/ smoke machines:

Whilst we love haze and smoke, the lead singer of the band is very conscious of too much haze/ smoke being used and affecting his voice. Therefore all smoke machines and hazers must be controllable through the lighting desk, and be of a type whereby the output can be controlled, i.e. not just ON at 100%. This is not acceptable.

There is a possibility that we shall be bringing a haze diffusing set up for the tour, but that is still TBC at this point.

7/. Houselights:

During the last number of the show, there will be a live call for ALL of the houselights to be put on immediately. The house should therefore be in a position to honour this request. The houselights operator will either be issued with a radio, or a set of intercom will be provided to stay in touch with either the LD or the Stage Manager.

As an alternative, if control of all of the houselights can be controlled through the lighting desk, this should be encouraged, and all patch information given in advance to the LD.

Many thanks for your attention.

Any questions etc, my numbers and email addresses are above.

We all look forward to seeing you in a field somewhere in Europe this summer.

Kindest regards,

Martin Brennan,
Lighting Designer,
Limp Bizkit.
